

PERFORMANCE TESTING

@DIGITEST

THE FUTURE

Performance Test Engineer

PERFORMANCE TESTING

1. A non-functional testing type.
2. This type of testing determines or validates:
 - **S**peed
 - **S**calability
 - **S**tability

Of the system or application under test.

=> 3S <=

PERFORMANCE TESTING

“**Performance**” refers to information related to the application:

- **Response times**
- **Throughput**
- **Resource utilization levels.**

RESPONSE TIMES

Time of each transactions took to complete. Response time is defined as the **delay between the point of request and the first response from the product.**

THROUGHPUT

Throughput represents the number of request / business transactions processed by the product in a specified time duration.

$$\text{Throughput} = \text{Request} / \text{Time}$$

WHY DO PERFORMANCE TESTING?

- **Access production readiness**
- **To compare two platform**
- **Find the source performance problems**
- **Support system tuning**

PERFORMANCE TEST TYPES

- **Load Testing**
- **Stress Testing / Spike Testing**
- **Endurance Testing**
- **Volume Testing**

LOAD TESTING

- **This subcategory of performance testing.**
- **Study about behaviour of the application under various loads.**
- **To check how the application handles concurrent users effectively.**
- **Main parameter to focus: Response time**

STRESS TESTING

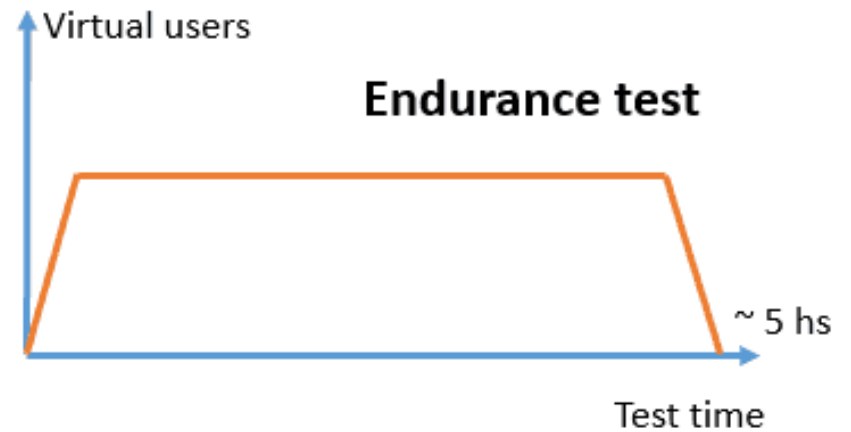

- **This subcategory of performance testing**
- **Stress Testing help us to observe the stability of the application.**
- **The main intention is to identify the breaking point of the server. The main parameter to focus is throughput (how much data is being transferred between client and server).**
- **Main parameter to focus: Response time and Throughput**

ENDURANCE TESTING

- **Endurance testing reveals about memory utilization when you load your test for prolong executions.**
- **If you execute your test 1 hour to perform load testing. But in endurance testing, you execute your test at least for 8 hours with significant load.**
- **Main parameter to focus: Memory**

VOLUME TESTING

- **Volume Testing is performance to identify whether the server can handle more number of high complex queries under significant load.**
- **The main intention is to observe how the database acts under various circumstances.**
- **Main parameter to focus: Response Time of Queries**

PERFORMANCE TEST TOOLS

- **Jmeter**
- **Gatling**
- **Load Runner**
